

Dynamic Mechanical Analysis at PPRC

- Using DMA, our polymer experts can study events in polymers such as the glass transition temperature and smaller transitions that aren't visible on other thermal techniques.

- Mechanical response of the polymer can be assessed over a wide range of temperatures which allows insight in to how a product will behave over a range of service conditions.

- The technique is versatile with a number of set up geometries ensuring a wide range of materials can be assessed from soft hydrogels and elastomers up to rigid thermosets and engineering polymers.
